Purified using IMAC,SEC

Possible mutants

As well as the obvious active site mutant C148A

SGLVKM SHPSGDVEACMVQVTCGSMTLNGLWLDNTVWCPRHVMCPADQLSDPNYDALLISMTNHSFSVQKHIGAPANLRVVGHAMQGTLLKLTVDVANPSTPAYTFTTVKPGA AFSVLACYNGRPTGTFTVVMRPNYTIKGSFLCGSAGSVGYTKEG SVINFCYMHQMELANGTHTGSAFDGTMYGAFMDKQVHQVQLTDKYCSVNVVAVWLYAA ILNGCAWFVKPNRTSVVSFNEWALANQFTEFVGTQSV DMLAVKTGVAIEQLLYAIQQLYTGFQ GKQILGSTMLEDEFTPEDVNMQIMGVVMQ

One apparent issue with MERS MPRO is its interconversion from monomer to dimer upon substrate binding according to the below PLOS article the dissociation constant of the MERS dimer, as measured by AUC, in the absence of substrate is 7.7 uM while that of the SARS is more that 10 fold lower at 0.7 uM. In the presence of substrate the Dissociation constants are much more similar 0.7 and 1.7 for MERS and SARS respectively. The MERS monomer to dimer dissociation constant can be lowered by mutating M298 to R (1.1 uM).

SGLVKM SHPSGDVEACMVQVTCGSMTLNGLWLDNTVWCPRHVMCPADQLSDPNYDALLISMTNHSFSVQKHIGAPANLRVVGHAMQGTLLKLTVDVANPSTPAYTFTTVKPGA AFSVLACYNGRPTGTFTVVMRPNYTIKGSFLCGSCG SVGYTKEG SVINFCYMHQMELANGTHTGSAFDGTMYGAFMDKQVHQVQLTDKYCSVNVVAVWLYAA ILNGCAWFVKPNRTSVVSFNEWALANQFTEFVGTQSV DMLAVKTGVAIEQLLYAIQQLYTGFQ GKQILGSTMLEDEFTPEDVNRQIMGVVMQ

Making this mutation also removes any co-operativity observed in kinetics, Hill coefficient of 0

```

Andre is concerned that this construct does not allow the processsing of the N-terminus of MERS by itself which prevents it undergoing an induced fit mechanism that generates the native dimer preferably the protein would be made with a native N-terminus and allowed to process itself raises the question of how to purify it

COVID-19 is a deadly rampaging infectious disease with over 480 million cases worldwide. Unfortunately, effective therapies remain very limited. Novel antiviral agents are urgently needed to combat this global healthcare crisis. Here, we elucidate the structural basis for replicase polyprotein cleavage and substrate specificity of SARS-CoV-2 main protease (M^{pro}). Through analyzing a series of high-resolution structures of SARS-CoV-2 M^{pro} throughout the proteolytic process, we demonstrate the molecular mechanism of M^{pro} in proteolytic processing that confers substrate specificity. Substrate selectivity is revealed using structures of the H41A mutant in complex with six individual native cleavage substrates. Our study underscores the mechanistic function of M^{pro} in the viral life cycle, which provides structural insights to develop effective inhibitors against this essential target of SARS-CoV-2.

SARS-CoV M ^{pro}	890 ± 130	2.11 ± 0.15	-	0.7 ± 0.02	1.7 ± 0.03 ^c

^a Kinetic data of SARS-CoV M^{pro} and MERS-CoV M298R and T126S/M298R mutants were fitted to the Michaelis-Menten equation (Eq 1), while those of the others were fitted to the Hill equation (Eq 2). The R_{sq} were from 0.985 to 0.999, respectively. All the assays were repeated twice and the average values were used for the fitting.

^b The values were derived from a global fit of the AUC data to a monomer-dimer self-association model by SEDPHAT [32]. The experiments for the assay were obtained at protein concentration of 1.5 to 30 μM.

^c The value was from our previous studies for comparison [28].

doi:10.1371/journal.pone.0144865.t002

Restrictions on Gene ordering

Apparently some issues whant trying to order this gene from companies in the states (some US government restriction)

Try ordering as gBLOCK from IDT (made in Belgium so avoid US restrictions?)
nope rejected due to below

Unfortunately the sequence for reference number 232813136 "AVID_1" includes a partial or full coding region from MERS. Unfortunately this item qualifies as an ECCN 1C353 item under U.S. Dept. of Commerce Export Administration Regulations and therefore requires an export license for shipment outside the United States.

I regret to inform you that IDT's current policy prohibits us from shipping items that require this license, therefore we must cancel this item and issue a full refund. I apologize for any inconveniences this may have caused.

NBS biologicals UK based said also not possible, didn't cite legislation but said "high risk"

GeneArt simply cancelled order

Suspect will run into the same issue with all suppliers until relevant paperwork etc. in place

Title missing - double click to edit

according to the below at pH 8 and 30% glycerol activity is much reduced if we combine the two during purification and then after imac dialyze o/n against pH7 0% glycerol buffer can we get MERS 3CL to celave off its own tag

If one of the `MSAVLQ` mutants is slower processing this may work.

Construct Design and Expression of MERS-CoV 3CL^{Pro}

The gene encoding 3CL^{Pro} protease of MERS-CoV (amino acid residues 3248–3553 in the replicase polyprotein, GenBank™ accession number [AHC74086.1](#)) was codon-optimized for optimal expression in *E. coli* (BioBasic Inc). The gene was subcloned into pET-11a expression vector with an N-terminal His₆ tag followed by the nsp4₁nsp5 auto-cleavage site using the forward primer 5'-ATATACATATGCACCACCACCACCACGCGGTGTCTGCAGTCTGGTC-3' and the reverse primer 5'-GACGGATCCTTACTGCATCACACACCATGATCTGC-3'. The construct was verified by DNA sequencing at the Purdue University Genomics Core Facility. This construct results in the expression of MERS-CoV 3CL^{Pro} without any N- or C-terminal extensions. MERS-CoV 3CL^{Pro} was expressed through auto-induction in *Escherichia coli* BL21-DE3 cells in the presence of 100 µg/ml carbenicillin as described previously ([41](#)). Cells were harvested by centrifugation at 5000 × *g* for 20 min at 4 °C, and the pellets were stored at -80 °C until further use.

MERS-CoV 3CL^{Pro} Purification

Frozen pellets from 4 liters of bacterial cell culture were thawed on ice and resuspended in 250 ml of Buffer A (20 mM Tris, pH 7.5, 0.05 mM EDTA, 10% glycerol, and 5 mM β-mercaptoethanol (BME)), containing 500 µg of lysozyme and a small amount of DNase. Cells were then lysed using a single pass through a French press at 1200 p.s.i., and cell debris was removed from the cleared lysate by centrifuging at 29,000 × *g* for 30 min. Solid ammonium sulfate was added to the cleared lysate to a final concentration of 1 M through gradual mixing on ice.

Hydrophobic Interaction Chromatography

The cleared lysate, mixed with ammonium sulfate, was loaded at a flow rate of 3 ml/min onto a 60-ml phenyl-Sepharose 6 fast-flow high-sub column (Amersham Biosciences) equilibrated with Buffer B (50 mM Tris, pH 7.5, 1 M ammonium sulfate, 0.05 mM EDTA, 10% glycerol, and 5 mM BME). The column was then washed with 5× column volume (300 ml) of Buffer B at a flow rate of 4 ml/min. Protein was eluted using a 5× column volume (300 ml) linear gradient to 100% Buffer A. Fractions (12 ml) were collected, and those containing MERS-CoV 3CL^{Pro}, as judged through SDS-PAGE analysis and specific activity measurements, were pooled (120 ml) and exchanged into 2 liters of Buffer A via overnight dialysis in a 10,000 molecular weight cutoff SnakeSkin® dialysis tubing (Thermo Scientific).

DEAE Anion-exchange Chromatography

Dialyzed sample from the previous step was loaded at a flow rate of 3 ml/min onto a 120-ml DEAE anion-exchange column (Amersham Biosciences) equilibrated with Buffer A. The column was then washed with 2× column volume (240 ml) of Buffer A at a flow rate of 4 ml/min. A linear gradient (total volume 480 ml) to 40% Buffer C (50 mM Tris, pH 7.5, 1 M NaCl, 0.05 mM EDTA, 10% glycerol, and 5 mM BME) was used to elute the protein. Fractions (6 ml) were collected, and those containing MERS-CoV 3CL^{Pro} were pooled (66 ml) and dialyzed for 4 h in 4 liters of Buffer D (20 mM MES, pH 5.5, 0.05 mM EDTA, 10% glycerol, and 5 mM BME).

Mono S Cation-exchange Chromatography

Following dialysis, the pH of the sample was manually adjusted to 5.5 using 1 M solution of MES, pH 5.5, and any precipitated protein was removed by filtering through a 0.22-µm pore size Millex-GP filter (Millipore). The filtered sample was then loaded at a flow rate of 2 ml/min onto an 8-ml Mono S 10/100 column (Amersham Biosciences) equilibrated in Buffer D. The column was then washed with 5× column volume (40 ml) of Buffer D at a flow rate of 2 ml/min. Protein was eluted using a 25× column volume (200 ml) and a linear gradient to 50% Buffer E (50 mM MES, pH 5.5, 1 M NaCl, 0.05 mM EDTA, 10% glycerol, and 5 mM BME). Fractions (2 ml) were collected, and those containing MERS-CoV 3CL^{Pro} were pooled (22 ml) and concentrate to ~5 mg/ml.

Gel Filtration Chromatography

As the final purification step, the concentrated protein sample was loaded onto the preparation grade Superdex 75 26/60 gel filtration column (Amersham Biosciences) equilibrated with Buffer F (25 mM HEPES, pH 7.5, 10% glycerol, 2.5 mM dithiothreitol (DTT)). Protein was eluted isocratically at a flow rate of 1 ml/min with Buffer F. Fractions (2 ml) containing MERS-CoV 3CL^{Pro} were pooled (total volume of 34 ml) and concentrated to ~5 mg/ml. For final storage of the purified MERS-CoV 3CL^{Pro} enzyme, 300-µl protein aliquots were placed into 1-ml screw-cap vials, flash-frozen under liquid nitrogen, and then stored at -80 °C until further use.

MERS-CoV 3CL^{Pro} Crystallization, X-ray Data Collection, and Structure Determination—Purified MERS-CoV 3CL^{Pro} was concentrated to 1.6 mg/ml in 25 mM HEPES, pH 7.5, and 2.5 mM DTT. Inhibitor complexes of MERS-CoV 3CL^{Pro} with compounds 6 and 11 were formed by incubating MERS-CoV 3CL^{Pro} with the compounds in a 1:3 stoichiometric ratio at 4 °C overnight. After iterative rounds of optimization of the crystallization conditions based on the initial hits obtained from high throughput screening of Qiagen Nextel Screens, crystals of MERS-CoV 3CL^{Pro} inhibitor complexes suitable for x-ray diffraction were grown by the hanging-drop, vapor diffusion method at 20 °C in 0.2 M sodium acetate, 0.1 M BisTris, pH 7.0, and 20% PEG-3350 for the MERS-CoV 3CL^{Pro} and 6 complex, and 0.2 M ammonium acetate, 0.1 M BisTris, pH 5.5, 12% PEG-3350 for the MERS-CoV 3CL^{Pro} and 11 complex. For x-ray data collection, crystals were flash-cooled in liquid nitrogen after dragging the crystals through a cryo-solution that contained the crystallization solution supplemented with 15% 2-methyl-2,4-pentanediol.

Materials and Methods

Expression Plasmid Construction

The sequence of the MERS-CoV Mpro (GenBank accession number AHC74086; polyprotein residues 3248–3553) was synthesized (MDBio Inc.), digested by NdeI-XhoI and then inserted into the vector pET-28a(+) (Novagen). In this construct, the 6 x His tag is retained at the N-terminus. To remove the fusion tag and generate an authentic N-terminus for protein purification, the codons of the thrombin cutting recognition sequence and a NdeI cutting site were removed and then inserted the codons of Leu-Arg-Leu-Lys-Gly-Gly into the above vector. The forward primer sequence for site-directed mutagenesis was 5'-CATCACAGCAGCGGCTGCGTCTGAAAGGCGGCAGCGGTTTGGTGAAAATG-3' and the reverse primer was 5'-CATTTTCACCAACCGCTGCCGCTTTC AGACGCAGCGCGTGTGTGATG-3'. The reading frame of the final plasmid was confirmed by sequencing.

Expression and Purification of MERS-CoV Mpro

The expression vector was transformed into E. coli BL21 (DE3) cells (Novagen). Cultures were grown in 0.8 liters of LB medium at 37°C for 4 h, induced with 0.4 mM isopropyl-β-D thiogalactopyranoside, and then incubated overnight at 20°C. After centrifuging at 6,000 x g at 4°C for 15 min, the cell pellets were resuspended in lysis buffer (20 mM Tris, pH 8.5, 250 mM NaCl, 5% glycerol, 0.2% Triton X-100, and 2 mM β-mercaptoethanol) and then lysed by sonication. The crude extract was then centrifuged at 12,000 x g at 4°C for 25 min to remove the insoluble pellet. Next the supernatant was incubated with 1-ml Ni-NTA beads at 4°C for 1 h and then loaded onto an empty column. After allowing the supernatant to flow through, the beads were washed with washing buffer (20 mM Tris, pH 8.5, 250 mM NaCl, 8 mMimidazole, and 2 mMβ-mercaptoethanol). The SARS-CoV papain-like protease [12] (1 mg in 100 mM phosphate buffer (pH 6.5)) was then added and incubated for 3 h. The SARS-CoV papain-like protease digestion, which removed the 6 x His tag and Leu-Arg-Leu-Lys-Gly-Gly fragment, resulted in a native protein product with an authentic N-terminus. The digest was allowed to flow through and then loaded onto a S-100 gel-filtration column (GE Healthcare) equilibrated with running buffer (20 mM Tris, pH 8.5, 100 mM NaCl, and 2 mMdithiothreitol). The purity of the fractions collected was analyzed by SDS-PAGE and the protein was concentrated to 30 mg/ml by Amicon Ultra-4 10-kDa centrifugal filter (Millipore).

Protein Crystallography

Crystals of the MERS-CoV Mpro were obtained at 295 K by the sitting-drop vapor-diffusion method. The protein solution was set up at 5 mg/ml and the reservoir solution consisted of 0.1M Tris, pH 8.4, 15% (w/v) PEG 4000 and 0.2 M sodium acetate. Clusters of needle crystals appeared in 2 days and were used for micro-seeding. Single crystals of rectangle shape and with dimensions of 0.3–0.5 mm were obtained in less than a week. All crystals were cryoprotected in the reservoir solution with 15% glycerol and were flash-cooled in liquid nitrogen.

4.5. X-ray crystallographic studies. Crystallization and data collection

Purified MERS-CoV 3CLpro, in 100 mM NaCl, 20 mM [Tris](#) pH 8.0, was concentrated to 8 mg/mL (0.5 mM). Stock solutions of 100 mM GC376, GC813, compound **10c** or compound **10e** were prepared in DMSO and the complex with MERS 3CLpro was prepared by mixing the concentrated protein supplemented with 3 mM compound and incubating overnight at 4 °C. All crystallization experiments were conducted using Compact 300 (Rigaku Reagents) sitting drop vapor diffusion plates at 20 °C using equal volumes of protein and crystallization solution equilibrated against 75 µL of the latter. Crystals of MERS 3CLpro in complex with GC813, compound **10c** and compound **10e** that displayed a prismatic morphology were obtained from the Index HT screen (Hampton Research) condition G10 (25% (w/v) PEG 3350, 100 mM Bis-Tris pH 5.5, 200 mM MgCl₂) in 1–2 days. Crystals of the GC376 complex were obtained from the Index HT screen (Hampton Research) condition E6 (30% (v/v) PEG 550 MME, 100 mM Bis-Tris pH 6.5, 50 mM CaCl₂). Samples were transferred to a fresh drop containing 80% crystallant and 20% (v/v) PEG 200 before storing in [liquid nitrogen](#). X-ray diffraction data were collected at the Advanced Photon Source beamline 17-ID using a Dectris Pilatus 6 M pixel array detector.
